BL shelfmark Or.8210/P.2 · Wikidata Q28097186
R18★ acquired_by
R19 is one documented case of R9: the British Library holds this item. R9 itself stays a general relation (◇): the page does not say which items.

Relations and evidence

→ R1–R15 Direct: extracted or modelled directly from the frozen Wikipedia revision
(no independent historical verification implied)

⇢ R16–R19★ Enriched: supported by an additional authoritative source
(R16: a project interpretation; R17–R19: one documented item, IDP)

⋯▶ has subject: the corpus classified by tradition

◇ not formalised — R9, R12: theoretical relations kept; no holding triple is asserted in the RDF
(the source does not say which manuscripts these institutions hold)

⑥ Repeated box (same number, “as in layer …”) = the same entity drawn again, not an additional entity

Evidence types (TEI taxonomy, also skos:definition in the RDF)

Direct — A relation extracted or modelled directly from the frozen Wikipedia revision, without implying independent historical verification.

Enriched — Enriched relation supported by an additional authoritative source rather than by the frozen Wikipedia revision. In this project: R16 is the project's interpretation of the International Dunhuang Project's (now International Dunhuang Programme) institutional description; R17-R19 add one documented item, the printed Diamond Sutra of 868 (British Library, Or.8210/P.2), from the IDP catalogue and research articles. Each Enriched relation points to its own sources (relation/@source, listBibl enrichment-sources) and is kept distinct from Direct evidence drawn from the frozen Wikipedia revision.

Natural-language layer: these entity types and relations are refactored into ontology classes and properties in the conceptual model.
Full authority numbers are printed for five entities; every record is in models/authority_linking_table.md.
Relations formalised in the RDF: R1–R8, R10, R11, R13–R19 (38 conceptual triples); R9 and R12 are not.
