Conceptual model — subjects, identifiers and evidence (Graffoo)

The layer that documents the core model: who or what an entity is elsewhere, what the corpus is about, and where each conceptual relation comes from.

A Identifiers and authority links

CIDOC CRM identifier pattern for every authority number; external links chosen by what they claim

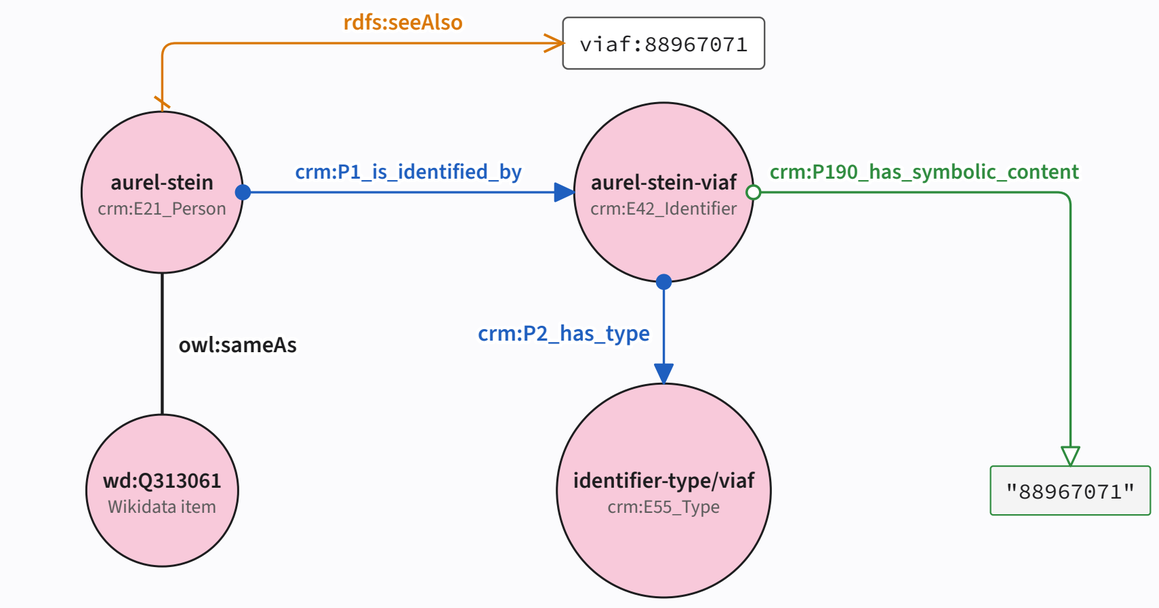

CLASS LEVEL

classes of the core diagram that carry authority identifiers

45 identifiers in 8 schemes: Wikidata, VIAF, LC names, LCSH, FAST, FAST control number, WorldCat Entity, British Library shelfmark.
Every number is kept as data, whatever external link is added (or not) for the same scheme.

EXAMPLE FROM THE DATA

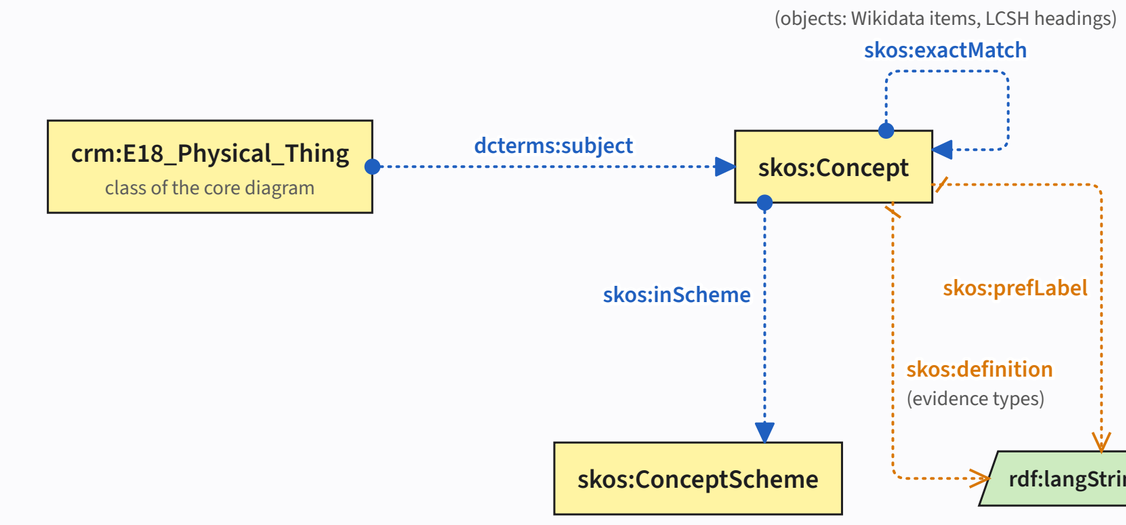

owl:sameAs — the same individual (persons and groups): 10 links
rdfs:seeAlso — a description elsewhere, no identity claim: 30 links
Aurel Stein also has rdfs:seeAlso to LC n82045000 and WorldCat; the corpus and the places link to Wikidata with rdfs:seeAlso, not owl:sameAs.

B Subjects

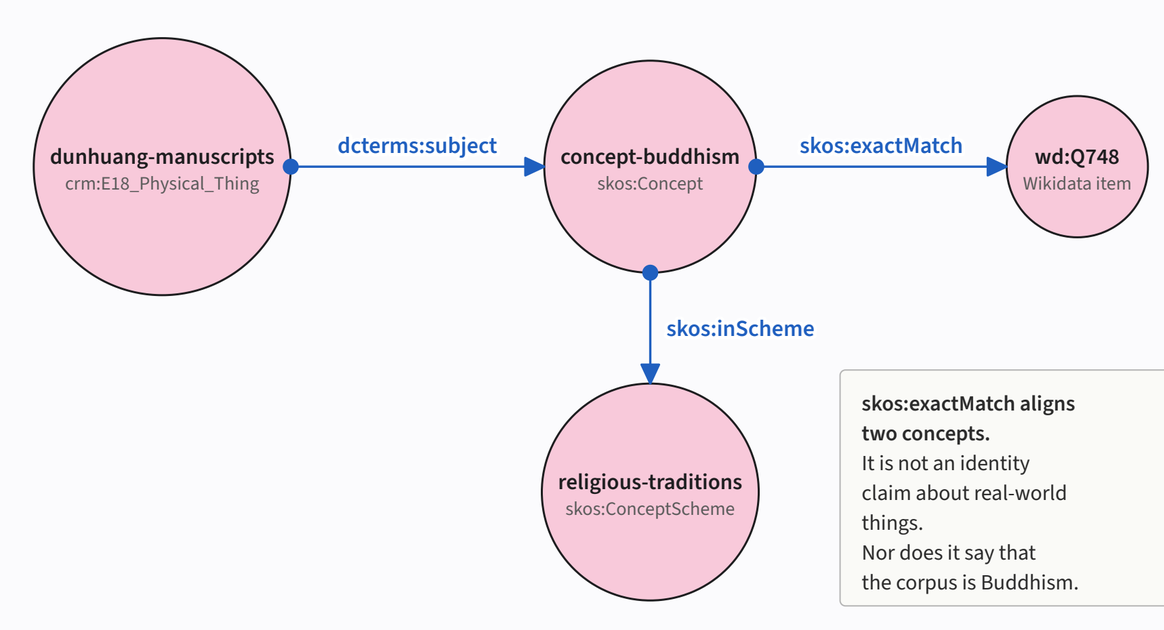

The religious and philosophical traditions in the source as a SKOS concept scheme, aligned to Wikidata and LCSH

CLASS LEVEL

6 subjects: Buddhism, Daoism, Confucianism, Nestorian Christianity, Manichaeism, Judaism.
skos:exactMatch: 6 to Wikidata, 5 to LCSH (none found for Nestorian Christianity).

EXAMPLE FROM THE DATA

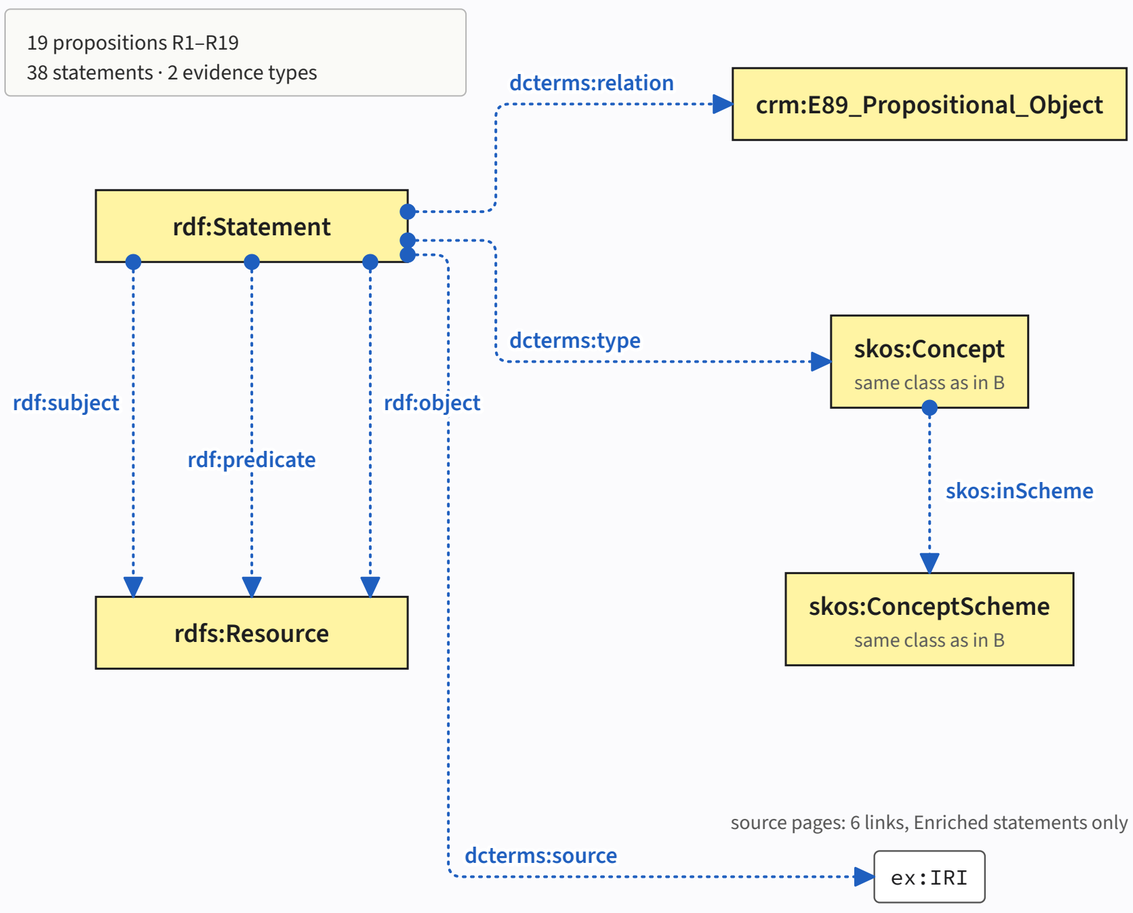

skos:exactMatch aligns two concepts.
It is not an identity claim about real-world things.
Nor does it say that the corpus is Buddhism.

C Evidence: from the theoretical model to the triples

Only the 38 conceptual-relation triples (the formalisations of R1–R19) are restated as rdf:Statement — not all 683 triples of the dataset

CLASS LEVEL

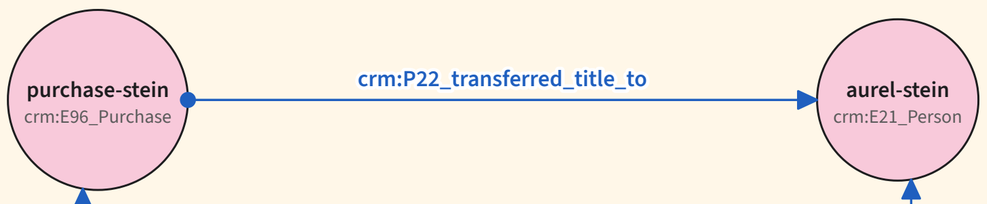

19 propositions R1–R19
38 statements · 2 evidence types

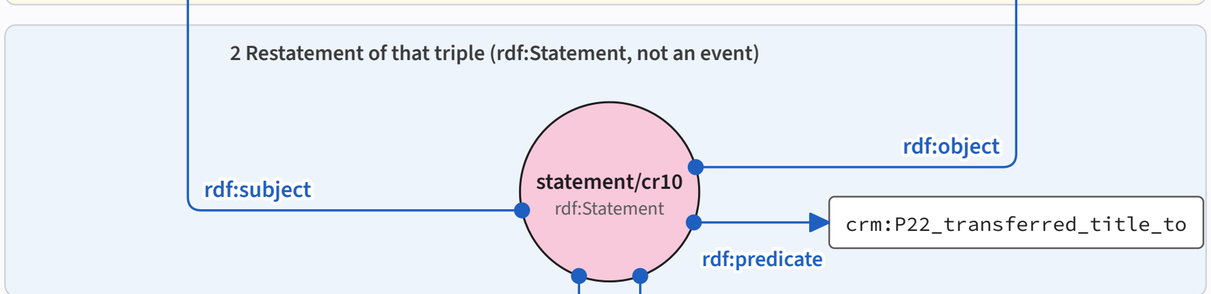

rdf:subject, rdf:object: resources of the core diagram; rdf:predicate: the property of the restated triple. A proposition can be restated by several statements (R6: 5) or by none (R9, R12).

EXAMPLE FROM THE DATA

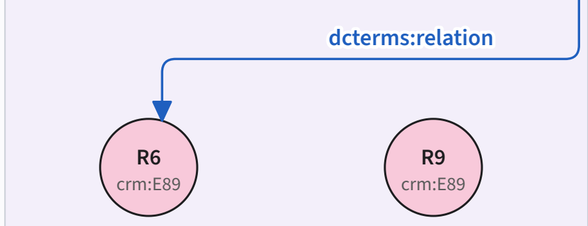

1 Historical event, as data: one triple of the dataset

2 Restatement of that triple (rdf:Statement, not an event)

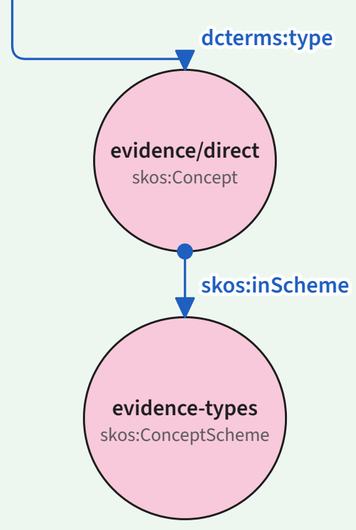

3 Proposition of the theoretical model

R6 is restated by 5 statements:
cr9, cr10, cr11, cr31, cr36.
R9, R12 (held_by): none.

4 Evidence type

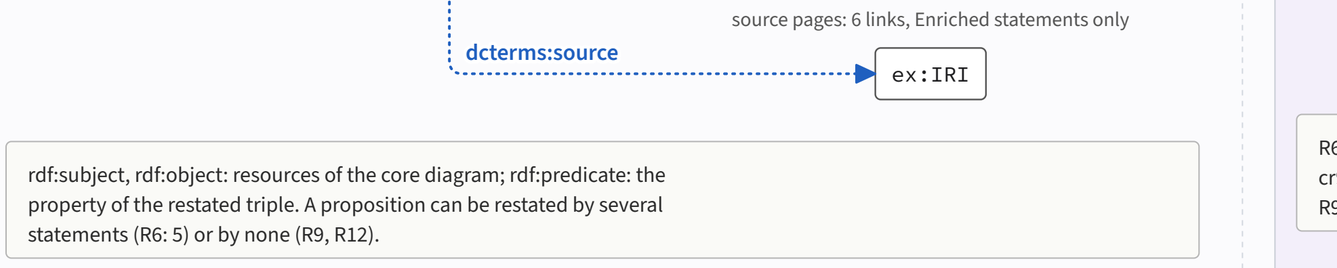

skos:definition of evidence/direct (34 statements):
“A relation extracted or modelled directly from the frozen Wikipedia revision, without implying independent historical verification.”

skos:definition of evidence/enriched (4 statements, R16–R19):
“Enriched relation supported by an additional authoritative source rather than by the frozen Wikipedia revision. In this project: R16 is the project's interpretation of the International Dunhuang Project's (now International Dunhuang Programme) institutional description; R17-R19 add one documented item, the printed Diamond Sutra of 868 (British Library, Or.8210/P.2), from the IDP catalogue and research articles. Each Enriched relation points to its own sources (relation/@source, listBibl enrichment-sources) and is kept distinct from Direct evidence drawn from the frozen Wikipedia revision.”

Three layers, three kinds of resource
1 purchase-stein (crm:E96_Purchase) stands for the historical sale; the triple purchase-stein P22 aurel-stein is a fact of the dataset.
2 statement/cr10 (rdf:Statement) restates that one triple so that it can be annotated. It is not the sale and it is not the proposition.
3 R6 (crm:E89_Propositional_Object) is a proposition of the theoretical model, in natural language (“sold manuscripts to”); statements point to it with dcterms:relation.

Graffoo notation

Dotted arcs: properties defined in CIDOC CRM, SKOS, DCTerms or RDF, used here; they assert no domain or range.
